

Lecture (01)

Introduction To System Administration

By:

Dr. Ahmed ElShafee

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Introduction

- There is a sharp distinction between administration and software development, but in reality, most professional system administrators spend a lot of time writing scripts.
- While this doesn't make system administrators, software developers, but it does mean that they need many of the same analytical and architectural skills processed by the software developer.
- the main tasks that system administrators are expected to perform are not always carried out by a single person, and at many sites the work is distributed among a team.

Y

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

- However, at least one person must understand all the components and make sure that every task is being done correctly.

- Account Provisioning
- Adding And Removing Hardware
- Performing Backups
- Installing And Upgrading Software
- Monitoring The System
- Troubleshooting
- Maintaining Local Documentation
- Monitoring Security
- Fire Fighting (it worked yesterday)

Y

Account Provisioning

- The system administrator adds accounts for new users, removes the accounts of users that are no longer active, and handles all the account-related issues that may arise, e.g., forgotten passwords.
- The process of adding and removing users can be automated, but certain administrative decisions, such as where to put a user's home directory, which machines to create the account on, etc., must still be made before a new user can be added.

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

1

- When a user should no longer have access to the system, the user's account must be disabled.
- All the files owned by the account should be backed up and then disposed of so that the system does not accumulate unwanted baggage over time.

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Adding And Removing Hardware

- When new hardware is purchased or when hardware is moved from one machine to another, the system must be configured to recognize and use that hardware.
- Hardware support duties can range from the simple task of adding a printer to the more complex job of adding a disk array.

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

1

- Now that virtualization has arrived in the enterprise computing arena, hardware configuration can be more complicated than ever.
- Devices may need installation at several layers of the virtualization stack, and the system administrator may need to formulate policies that allow the hardware to be shared securely and fairly.

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Performing Backups

- Performing backups is perhaps the most important job of the system administrator, and it is also the job that is most often ignored or rarely done.
- Backups are time consuming and boring, but they are absolutely necessary.

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

- Backups can be automated and delegated to an underling, but it is still the system administrator's job to make sure that the backups are executed correctly and on schedule, and that the resulting media can actually be used to restore files.

Installing And Upgrading Software

- When new software is acquired, it must be installed and tested, often under several different operating systems and on several types of hardware.
- Once the software is working correctly, users must be informed of its availability and location.

- As patches and security updates are released, they must be incorporated smoothly into the local environment.
- Local software and administrative scripts should be properly packaged and managed in a fashion that is compatible with the native upgrade procedures used on the system at your site,

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Monitoring The System

- Large installations require constant supervision.
- Don't expect users to report problems to you unless the issues are severe.
- Working around a problem is usually faster than taking the time to document and report it, so users often follow the path of least resistance.

- As this software evolves, new releases should be staged for testing before being deployed to the entire site.

Maintaining Local Documentation

- As a system is changed to upgraded and re-configured according to organization's need, it begins to differ from the startup system as described by the documentation.
- Since the system administrator is responsible for making these customizations, it is also the sysadmin's duty to document the local changes.

- Regularly ensure that
 - email and web services are working correctly,
 - watch log files for early signs of trouble,
 - make sure that local networks are properly connected,
 - keep an eye on the availability of system resources such as disk space.
- All of these tasks are excellent candidates for automations, and a variety of off-the-shelf monitoring systems can help system administrators with these tasks.

١٥

١٦

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Monitoring Security

- The system administrator must implement a security policy and periodically check to be sure that the security of the system has not been violated.
- On low-security systems, might only involve a few basic checks for unauthorized access.
- On high-security systems, it may include an elaborate network of traps and auditing programs.

١٧

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

- This include documenting
 - where cables are run and how they are constructed,
 - keeping maintenance records for all hardware,
 - recording the status of backups, and
 - documenting local procedures and policies.

١٧

Dr. Ahmed ElShafee, ACU : Fall 2014, Selected Topics in Computer Networks

Fire Fighting (it worked yesterday)

- Although helping users with their various problems is rarely included in a system administrator's job description, it often claims a significant portion of most administrators' workdays.
- System admins are flooded with problems ranging from

"it worked yesterday and now it doesn't! What did you change?"
to

" I spilled coffee on my keyboard! Should I take it to the water sink and wash it out?"

- In most cases, your response to these issues affects your image as an administrator far more than does any actual technical skill you might possess.

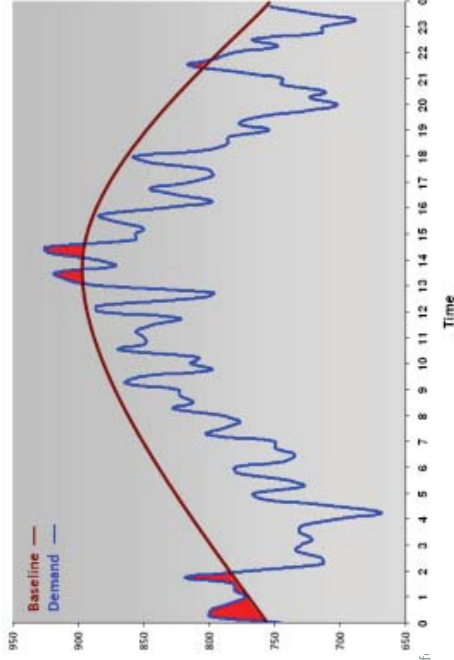

١٧

Dr. Ahmed ElShafee, ACU : Fall 2

Baselining

- Baselining is used to generate system reports and correlate system growth and changes over time.

Dr. Ahmed ElShafiq

Y1

- Baselining is a method for analyzing computer network performance. The method is marked by comparing current performance to a historical metric, or "baseline". For example, if you measured the performance of a network switch over a period of time, you could use that performance figure as a comparative baseline if you made a configuration change to the switch.

Dr. Ahmed ElShafiq, ACU : Fall 201

Y1

- It is a useful technique to assist in ordering suppliers, spares, hardware and software upgrades in a timely manner.
- Knowing the baseline performance and needs of the system over time is a useful organizational tool and the baseline is often provided by the system administrator.

Dr. Ahmed ElShafiq, ACU : Fall 201

Y1

Planning

- System administrators often devote a great deal of their time to generate reports useful for organizational planning.
- Cost, capacity, logistics (network design, server location, where to install wiring, IP address assignments, etc).
- Cost benefit analysis is a common feature of many planning reports/documents.

Dr. Ahmed ElShafiq, ACU : Fall 2014, Selected Topics in Computer Networks

Y1

Four Rules A System Administrator Should Never Break

1. Backup Everything (and validate the backup regularly).
2. Master the Command Line. (Especially true for Unix/Linux SAs, less true for Windows SAs.)
3. Automate Everything. Routine tasks should not be done manually.
4. Document Everything. Every change to your system should be thoroughly documented.

Thanks,..
See you next week (ISA),...
